

*ABSTRACT AMENDMENTS*

Replace the Abstract with:

A tank filled with an insulating gas accommodates insulator tubes incorporating vacuum-valve breakers for individual phases. One end of each insulator tube is fixed to the inside of the tank. Each vacuum-valve breaker is installed generally on a common longitudinal axis with the ~~relevant~~ corresponding insulator tube ~~in such a manner so that its a~~ movable electrode rod is directed toward ~~the a~~ fixed end of the insulator tube. The insulator tube has as ~~its an~~ integral part a bus line fixing portion projecting in a direction intersecting the longitudinal axis of the insulator tube from the proximity of ~~its an~~ end opposite to the fixed end ~~to support, supporting~~ a bus-side conductor in an insulated fashion.
